

## **MAILCALL**

Email to Export Accounts

*April 21, 2006*

In the last **MAILCALL**, we reviewed our thoughts about using a very low profile bolt for the lower tab bracket and asked for comments. All comments received were positive, so we have put this change in place, and this week, will begin shipping tabs with square holes to accommodate the new low head profile bolts with the square section under the head to keep them from turning during installation. The two bolts and two self locking nuts will be in a small plastic bag taped to each tab. Also, with your next shipment of tabs for your distributor stock, we will include 20 bolts and nuts so you will have some handy if needed, courtesy of Lectrotab.

The new "OVAL", models SETR-50, gray and SETR-51, black, are in service and doing very well. Remember, the orange and blue twisted, 18" wire pair, which is plugged into each "OVAL" is used only in multiple station installations. If the installation is a single station, unplug and discard the wire assembly. Or, you can leave it plugged in with the ends taped off so it will be there if the boat is ever upgraded to multiple stations.

The next **MAILCALL** will be during the first week of May and subsequently will be monthly. However, if something of interest comes up, we will get an interim MAILCALL out on the subject.

Please contact us anytime. Use [mailcall@lectrotab.com](mailto:mailcall@lectrotab.com) for your reply. Our responses will be quick.

Best Regards,

Lectrotab Sales
